Effective teaching is a complex art. It requires sensitivity to the unique objectives of the course, the personality and preferred communication/interaction style of the instructor, the background and motivation of the students, and the peculiarities of the discipline. It is these factors and their interactions that determine the degree to which desired outcomes are achieved. Although student ratings cannot provide all of the information needed to evaluate and improve instruction, this guide will help you make more complete and accurate interpretations of results from the IDEA Short Form Report.

The IDEA Short Form Report is designed to respond to four questions:

1. Overall, how effectively was this class taught?
2. How does this compare with the ratings of other teachers?
3. Were you more successful in facilitating progress on some class objectives than on others?
4. Do some salient characteristics of this class and its students have implications for instruction?

Two kinds of scores are reported: “Average” scores are based on a 5-point rating scale, while “Converted” scores all have an average of 50 and a standard deviation (measure of variability) of 10. Both “Average” and “Converted” scores are presented in “raw” (unadjusted) and “adjusted” forms. Each type of score is important to a complete understanding of your results.

Question 1. Overall, how effectively was this class taught? (Refer to the tables and graph reported on Page 1 of the IDEA Short Form Report.)

One of the best ways to infer teaching effectiveness is to examine student ratings of progress on objectives chosen as Important or Essential by the instructor. The average of these ratings provides a good indication of how successfully objectives were reached, especially if at least 10 students provided ratings and if at least 75% of enrollees responded.

Progress ratings are made on a 5-point scale: 1=No apparent progress; 2=Slight progress; 3=Moderate progress; 4=Substantial progress; and 5=Exceptional progress. In interpreting “raw” and “adjusted” averages, these terms can be substituted for the numeric figures; e.g., an average of 4.0 indicates that “substantial progress” is an appropriate term for summarizing student ratings.

An overall index of teaching effectiveness (PRO=Progress on Relevant Objectives) combines ratings of progress on the objectives identified by the instructor as Important (weighted “1”) or Essential (weighted “2”). The IDEA Center regards this as its single best estimate of teaching effectiveness. Raw and adjusted PRO scores are provided for converted averages as well as for those based on the 5-point rating scale. Converted averages are preferred when making comparisons among faculty members or classes because they take into account the fact that average progress ratings are much higher for some objectives than for others; that is, some objectives appear to be more easily achieved than others. Converted scores assure faculty members that they will not be penalized for selecting objectives that are especially difficult.

Two additional overall measures of teaching effectiveness are shown on the report. These are the average ratings of two items using a 5-point scale (1=Definitely false; 5=Definitely true):

1. Overall, I rate this instructor an excellent teacher.
2. Overall, I rate this course as excellent.

Ratings of progress on individual objectives are provided on Page 2 of the report and can address Question 3.
As an index of teaching effectiveness, the average of these two ratings is commonly regarded as about equal in value to the “Progress on Relevant Objectives” index described above. Therefore, the Summary Evaluation reported on Page 1 averages the PRO score with the average of these two ratings. Although many IDEA users find this method of arriving at a Summary Evaluation to be meaningful, some may feel that other methods for arriving at a summary judgment better reflects their institution’s philosophy and/or priorities; they are encouraged to define a process or use an index that best reflects the local situation.

Question 2. How do your ratings compare with those of other teachers? (Refer to the comparisons shown on the right hand side of Page 1 of the IDEA Short Form Report.)

Criterion-referenced standards avoid comparisons that can promote an unhealthy competitive atmosphere. Still, many institutions believe a “Norm-referenced” (comparison-based) framework provides a better basis for making judgments about teaching effectiveness. Your report compares your average ratings to results for three different groups of classes. The first comparison group is with all classes in the standard IDEA database, and is always reported. The other two are reported only if enough classes were available to provide a stable basis for comparison. These consist of (1) all classes in the same discipline as the class in question and (2) all classes at your institution. Institutional and disciplinary norms are updated annually and include the most recent five years of data; the IDEA database is updated on a periodical basis.

Question 3. Were you more successful in facilitating progress on some class objectives than on others? (Refer to the upper portion of Page 2 of the IDEA Short Form Report.)

The first portion of Page 2 lists the 12 objectives included on the IDEA form and summarizes student ratings on those you selected as either Important or Essential. A review of the specific objectives can help you determine where you might focus improvement efforts.

The reporting format is similar to that used on Page 1. In addition to “raw” and “adjusted” scores, the report shows the percent of students making ratings in the two lowest categories (No apparent progress or Slight progress) and in the two highest categories (Substantial progress and Exceptional progress). “Converted scores” are shown in the right hand section and compared with the three norm groups previously described (IDEA Database and, if available, Discipline and Institution). In addition to the actual converted average, the report describes the status of each relative to other classes in the comparison group: “Much higher” (highest 10%); “Higher” (next 20%); “Similar” (Middle 40%); “Lower” (Next 20%); or “Much Lower” (lowest 10%). Using broad categories like these rather than precise numbers is a reminder that ratings are neither perfectly reliable nor perfectly valid.

Question 4. Do some salient characteristics of this class and its students have implications for instruction? (Refer to the bottom portion of Page 2 of the IDEA Short Form Report.)

Student Characteristics. Students described their motivation by making self-ratings on the two items listed at the bottom of Page 2. These characteristics have been found to impact student ratings of progress.

Page 3 of the Report provides a detailed statistical summary of student responses to each of the items on the IDEA form as well as to optional locally devised items, if any.
